

Whether it happens at work or on the golf course, overexertion continues to be a leading cause of injury over all age groups. It was the second leading reason after falls that adults age 25-64 ended up in emergency departments. Overexertion causes 35% of all work-related injuries and is, by far, the largest contributor to workers' compensation costs – more than \$15 billion according to Injury Facts 2016®. It also is the #1 reason for lost work days and the trend doesn't seem to be going downward. What gives?

## It's Really About Ergonomics

Ergonomic injuries are disorders of the soft tissue, specifically of the muscles, nerves, tendons, ligaments, joints, cartilage, blood vessels and spinal discs caused by:

- Excessive lifting, lowering, pushing, pulling, reaching or stretching
- Repetitive motion
- Working in awkward positions
- Sitting or standing for prolonged period of time
- Using excessive force
- Vibration, resting on sharp corners or edges
- Temperature extremes

Whether you become injured on an assembly line or typing on a computer, playing video games or helping someone move, it's important to know the signs. Ergonomic injury is cumulative. Symptoms can include everything from posture problems and intermittent discomfort, to tendonitis, chronic pain and disability.

## **Overexertion Can Be Prevented**

Regular exercise, stretching and strength training to maintain a strong core all are beneficial in preventing injury.

Below are some additional tips for work and home:

- Plan a lift before you begin, keep your back straight and lift with your legs
- Limit the amount of time you spend doing the same motion over and over
- Take frequent breaks from any sustained position every 20-30 minutes
- If you work at a desk, move frequently used items close to you, use a footrest and adjust the height of your computer
- Report pain, swelling, numbness, tingling, tenderness, clicking or loss of strength to your doctor before it becomes a full-blown injury
